

Clean Label Solution

Importance of Bypass Protein

- Protein is one of the most expensive macro-nutrients used in the dairy cow ration, and its optimal use reduces the dairy farmers' expenses. In high-yielding cows, microbial proteins can provide at most 60% of the protein required for metabolism in livestock, and 40% of the remainder should be supplied with bypass protein with high quality.

Increasing Production of Microbial Protein

- In general, the use of bypass proteins reduces the production of microbial protein. Clean label solution's product has specific compounds that can promote the growth of ruminal microorganisms.

Palatability

- Bi-Pass Pro has a very pleasant smell and delicious taste for cows which is due to its special processing.

The role of Bi-Pass Pro[®] in dairy cows
